

NAME

ksi verify - Verify KSI signature with KSI command-line tool.

SYNOPSIS

ksi verify -i *in.ksig* [-f *data*] [*more_options*]

ksi verify --ver-int -i *in.ksig* [-f *data*] [*more_options*]

ksi verify --ver-cal -i *in.ksig* [-f *data*] -X *URL* [--ext-user *user* --ext-key *key*] [*more_options*]

ksi verify --ver-key -i *in.ksig* [-f *data*] -P *URL* [--cnstr *oid=value*]... [-V *cert.pem*]... [-W *dir*]... [*more_options*]

ksi verify --ver-pub -i *in.ksig* [-f *data*] --pub-str *pubstr* [-x -X *URL* [--ext-user *user* --ext-key *key*]] [*more_options*]

ksi verify --ver-pub -i *in.ksig* [-f *data*] -P *URL* [--cnstr *oid=value*]... [-V *cert.pem*]... [-W *dir*]... [-x -X *URL* [--ext-user *user* --ext-key *key*]] [*more_options*]

DESCRIPTION

Verifies the given KSI signature and, if given, the file or its precomputed hash value. There are four main verification policies:

- Internal verification (**--ver-int**). Only internal consistency of the signature is checked and no trust anchor is used and no external resources are needed. This check is also performed as the first step in all other policies.
- Calendar-based verification (**--ver-cal**). Signature is verified against calendar blockchain database at the KSI Extender. Verification is done by checking that the output hash value computed from the aggregation hash chain matches the corresponding entry in the calendar blockchain. Access to KSI Extender is needed.
- Key-based verification (**--ver-key**). Signature must contain a calendar hash chain and a calendar authentication record that can be verified against the signing certificates. To be able to perform key-based verification user must have an access to a trusted KSI publications file with signing certificates in it.
- Publication-based verification (**--ver-pub**). Signature must be extended to a time of publication and contain a publication record unless automatic extension of the signature is enabled with **-x**. Verification is done by checking that the publication record in the signature matches a publication in the publications file or the publication string given on the command line. Publications file or publication string retrieved from printed media is needed.

It must be noted that only publication-based verification should be preferred in long term as it does not rely on any keys and trusted services. The other policies can be used temporarily when the signature is created and there is not yet a publication to extend the signature to.

OPTIONS**--ver-int**

Perform internal verification.

--ver-cal

Perform calendar-based verification (use extending service).

--ver-key

Perform key-based verification.

--ver-pub

Perform publication-based verification (use with **-x** to permit extending).

-i *in.ksig*

Specify the signature file to be verified. Use '-' as file name to read signature file from *stdin*.

-f *data*

Specify file to be hashed or precomputed data hash imprint to extract the hash value that is going to be verified. Hash format: <alg>:<hash in hex>. Use '-' as file name to read data to be hashed

from *stdin*. Call **ksi -h** to get the list of supported hash algorithms.

-X URL

Specify the extending service (KSI Extender) URL.

--ext-user str

Specify the username for extending service.

--ext-key str

Specify the HMAC key for extending service.

-x

Permit to use extender for publication-based verification.

--pub-str str

Specify the publication string to verify with.

-P URL Specify the publications file URL (or file with URI scheme 'file://').

--cnstr oid=value

Specify the OID of the PKI certificate field (e.g. e-mail address) and the expected value to qualify the certificate for verification of publications file's PKI signature. At least one constraint must be defined. All values from lower priority source are ignored (see **ksi-conf(5)** for more information).

For more common OIDs there are convenience names defined:

- **E** or **email** for OID 1.2.840.113549.1.9.1
- **CN** or **cname** for OID 2.5.4.3
- **C** or **country** for OID 2.5.4.6
- **O** or **org** for OID 2.5.4.10

-V file

Specify the certificate file in PEM format for publications file verification. All values from lower priority source are ignored (see **ksi-conf(5)**).

-W dir

Specify an OpenSSL-style trust store directory for publications file verification. All values from lower priority source are ignored (see **ksi-conf(5)**).

-d

Print detailed information about processes and errors to *stderr*.

--dump

Dump signature and document hash being verified in human-readable format to *stdout*.

--conf file

Read configuration options from given file. It must be noted that configuration options given explicitly on command line will override the ones in the configuration file (see **ksi-conf(5)** for more information).

--log file

Write libksi log to given file. Use '-' as file name to redirect log to *stdout*.

EXIT STATUS

See **ksi(1)** for more information.

EXAMPLES

In the following examples it is assumed that KSI service configuration options (URLs, access credentials) are defined. See **ksi-conf(5)** for more information. Signature files with extension **.ext.ksig** are extended and files with extension **.ksig** are not.

- 1 To perform internal verification of the KSI signature *test.ksig* and the data in the file *test*:

```
ksi verify --ver-int -i test.ksig -f test
```

- 2 To perform key-based verification of the KSI signature *test.ksig* and given document hash:

```
ksi          verify          --ver-key          -i          test.ksig          -f  
SHA-256:c8ef6d57ac28d1b4e95a513959f5fcdd0688380a43d601a5ace1d2e96884690a
```

- 3** To perform calendar-based verification of the KSI signature *test.ksig*:

ksi verify --ver-cal -i test.ksig

- 4** To perform publication-based verification of the KSI signature *test.ext.ksig*, using publication string:

ksi verify --ver-pub -i test.ext.ksig --pub-str AAAAAA-CWYEKQ-AAIYPA-UJ4GRT-HXMFBE-OTB4AB-XH3PT3-KNIKGV-PYCJXU-HL2TN4-RG6SCC-3ZGSBM

- 5** To perform publication-based verification of the KSI signature *test.ext.ksig*, using a publications file which is auto-downloaded and verified based on the default configuration options:

ksi verify --ver-pub -i test.ext.ksig

- 6** To perform publication-based verification of the KSI signature *test.ksig*, possibly extending it on the fly:

ksi verify --ver-pub -i test.ksig -x

- 7** To perform verification of the KSI signature *test.ksig* using any policy possible, depending on the current state of the signature and dump its content:

ksi verify -i test.ksig --dump

ENVIRONMENT

Use the environment variable **KSI_CONF** to define the default configuration file. See **ksi-conf(5)** for more information.
